

## Editorial Notice

Dear Colleagues,

You will find subjects from almost all areas of the neurosurgery spectrum covered in this issue. This is an indicator of how wide our field is. Interdisciplinary and transdisciplinary studies are becoming more and more popular, leading to an increase in the number of research fields together with new developments. Scientific journals are the best intermediaries to introduce new approaches, innovations and developments to the specialists of the relevant field.

Our journal and other neurosurgery journals therefore include an increasing number of articles on endovascular interventions for central nervous system vascular pathologies. It is encouraging to see neurosurgeons becoming more active in this field. However, working as a team is a must, as in all other areas. Working with radiology, neurology and anesthesiology specialists as a well-functioning team is extremely important both for the treated patient and for scientific developments in the neuro-endovascular field.

I hope to see you all again in the next issue.
